Reduced maintenance costs and higher productivity

Upgrades for optimal press utilization.

Newsprint gives off a lot of paper dust which mixes with the printing ink on the blankets. This build-up has a negative effect on print quality and so the blankets must be regularly cleaned by hand. But this is very time-consuming and therefore cost-intensive. It also requires a lot of manpower and press productivity is considerably reduced because of the time needed for cleaning.

manroland offers an automatic blanket washing system as an upgrade that minimizes the time needed for blanket washing and thus increases press productivity. This upgrade can be used for both coldset and heatset printing. The units are mounted directly at the blanket cylinders between the lower and upper arches of an H-type printing tower. Washing is fully automated and can be done with or without paper in the press. This upgrade can be retrofitted to almost all manroland presses. ■■

Advantages

- Perfect cleaning of the blankets improves print product quality
- Higher productivity
- Less valuable production time lost for blanket washing
- Long intervals between washing and short washing times reduce overall waste rates
- Printing personnel is available for other tasks

Modules

Brush-type washing systems are available with single or double washing beams
