# Intercom System

Intercom at the feeder.

Intercom at the delivery.

## High performance intercom

**Optimum communication through effective filtering of ambient noise and digital volume control.**

### **Improved information exchange in the pressroom**

Put an end to signaling by bell and hand or loud shouting in the pressroom. Especially with jobs that are carried out concurrently, communication should be clear, and misunderstandings avoided. It is the only way to work productively for high quality.

To optimize communication within the press crew, manroland offers intercom systems – now also as an upgrade. This feature is a big help with long machine configurations, in particular. Ambient noise in the pressroom is effectively filtered out and the volume can be digitally controlled. This ensures that information from the feeder is clearly understood as it arrives at the other end of the press.

The intercom system has been developed by manroland, and specifically fitted to conditions in the pressroom. For convenient operation, the movable microphones can be adapted to the operator in question. As an upgrade, the intercom system can be flexibly mounted on the press, depending on customer wish. ■■

## Advantages

- Improved communication of the press crew
- Avoidance of misunderstandings
- Higher working safety
